

Algorithms Pseudocode Flowcharts

Instructor Özgür ZEYDAN (PhD)

CIV 112 – Computer Programming
<http://cevre.beun.edu.tr/zeydan/>

Why do we have to learn computer programming?

- Computers can make calculations at a blazing speed without any error as compared to the humans.
- Example: calculate the prime numbers until 121.
- How long does it take?
- Do you do any error?

- Prime numbers: 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, 47, 53, 59, 61, 67, 71, 73, 79, 83, 89, 97, 101, 103, 109, 113
- Such a problem is so easy for a computer...

Instructor Özgür ZEYDAN

Calculate the prime numbers until 121

	2	3	4	5	6	7	8	9	10	Prime numbers
11	12	13	14	15	16	17	18	19	20	
21	22	23	24	25	26	27	28	29	30	
31	32	33	34	35	36	37	38	39	40	
41	42	43	44	45	46	47	48	49	50	
51	52	53	54	55	56	57	58	59	60	
61	62	63	64	65	66	67	68	69	70	
71	72	73	74	75	76	77	78	79	80	
81	82	83	84	85	86	87	88	89	90	
91	92	93	94	95	96	97	98	99	100	
101	102	103	104	105	106	107	108	109	110	
111	112	113	114	115	116	117	118	119	120

Instructor Özgür ZEYDAN

Performing a Task on The Computer

- The first step in writing instructions to carry out a task is to determine what the **output** should be—that is, exactly what the task should produce.
- The second step is to identify the data, or **input**, necessary to obtain the output.
- The last step is to determine how to **process** the input to obtain the desired output, that is, to determine what formulas or ways of doing things can be used to obtain the output.

Instructor Özgür ZEYDAN

A pictorial representation of problem-solving

Instructor Özgür ZEYDAN

Program Development Cycle

1. Analyze: Define the problem.

- Be sure you understand what the program should do, that is, what the output should be. Have a clear idea of what data (or input) are given and the relationship between the input and the desired output.

2. Design: Plan the solution to the problem.

- Find a logical sequence of precise steps that solve the problem. Such a sequence of steps is called an algorithm. Every detail, including obvious steps, should appear in the algorithm.

Instructor Özgür ZEYDAN

Program Development Cycle

3. **Choose the interface:** Select the objects.
 - Determine how the input will be obtained and how the output will be displayed. Then create appropriate commands to allow the user to control the program.
4. **Code:** Translate the algorithm into a programming language.
 - Coding is the technical word for writing the program.
5. **Test and debug:** Locate and remove any errors in the program.
 - Testing is the process of finding errors in a program, and debugging is the process of correcting errors that are found. (An error in a program is called a bug.)

Instructor Özgür ZEYDAN

Program Development Cycle

6. **Complete the documentation:** Organize all the material that describes the program.
 - Documentation is intended to allow another person, or the programmer at a later date, to understand the program. Internal documentation consists of statements in the program that are not executed, but point out the purposes of various parts of the program.
 - Documentation might also consist of a detailed description of what the program does and how to use the program (for instance, what type of input is expected).
 - For commercial programs, documentation includes an instruction manual.
 - Other types of documentation are the **flowchart** and **pseudocode**.

Instructor Özgür ZEYDAN

Programming Tools

- Tools used to convert **algorithms** into computer programs:
 - **Pseudocode**: An informal high-level description of the operating principle of a computer program. It uses the structural conventions of a programming language, but is intended for human reading rather than machine reading.
 - **Flowcharts**: Graphically depict the logical steps to carry out a task and show how the steps relate to each other.

Instructor Özgür ZEYDAN

Pseudocode vs Flowcharts

- | | |
|---|--|
| <ul style="list-style-type: none"> • Artificial and Informal language • Helps programmers to plan an algorithm • Similar to everyday English • Not an actual programming language | <ul style="list-style-type: none"> • A graphical way of writing pseudocode • Rounded rectangle – terminal • Parallelogram – input / output • Rectangle – actions • Diamonds – decision / conditional • Circles – connector |
|---|--|

Instructor Özgür ZEYDAN

Flowchart Symbols

Symbol,	Name,	Meaning
	<i>Flowline</i>	Used to connect symbols and indicate the flow of logic.
	<i>Terminal</i>	Used to represent the beginning (Start) or the end (End) of a task.
	<i>Input/Output</i>	Used for input and output operations, such as reading and printing. The data to be read or printed are described inside.
	<i>Processing</i>	Used for arithmetic and data-manipulation operations. The instructions are listed inside the symbol.
	<i>Decision</i>	Used for any logic or comparison operations. Unlike the input/output and processing symbols, which have one entry and one exit flowline, the decision symbol has one entry and two exit paths. The path chosen depends on whether the answer to a question is "yes" or "no."

Instructor Özgür ZEYDAN

Example Pseudocode

Start

Read A, B

Calculate $C = A * B$

Display C

Stop

Start - Terminal

Read A, B - Input

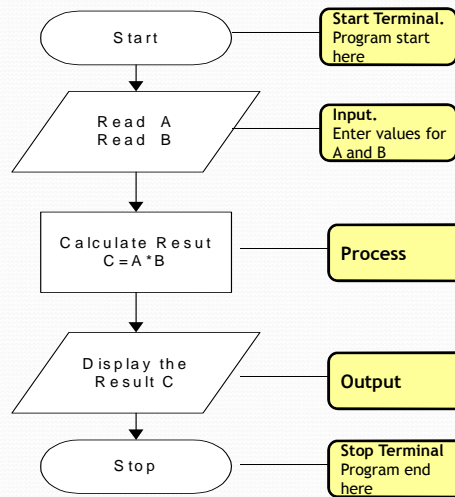

Calculate $C = A * B$ - Action

Display C - Output

Stop - Terminal

Instructor Özgür ZEYDAN

Example Flowchart

Instructor Özgür ZEYDAN

User Friendly Pseudocode

Start

Use variables A,B and C

Display “write two numbers”

Read A, B

Calculate $C = A * B$

Display “multiplication of numbers” , C

Stop

Instructor Özgür ZEYDAN

Question ???

- Write an algorithm to calculate Fahrenheit value of temperature if Celsius value is given.

- $$\frac{(F-32)}{180} = \frac{(C)}{100}$$

- Write a pseudocode.
- Draw a flowchart.

Instructor Özgür ZEYDAN

Structured Programming

- Structured programming was first suggested by **Corrado Bohm and Giuseppe Jacopini**. The two mathematicians demonstrated that any computer program can be written with just three structures: **sequences**, **decisions**, and **loops**.
- **Sequences**: one command is executed after previous one.
- **Decisions (selections)**: statement(s) is (are) executed if certain **condition** gives TRUE or FALSE value.
- **Loops (repetition)**: statement(s) is (are) executed **repeatedly** until certain **condition** gives TRUE or FALSE value.
- Corrado; B. and Jacopini, G. (May 1966). "Flow Diagrams, Turing Machines and Languages with Only Two Formation Rules". Communications of the ACM 9 (5): 366–371.

Instructor Özgür ZEYDAN

Sequence

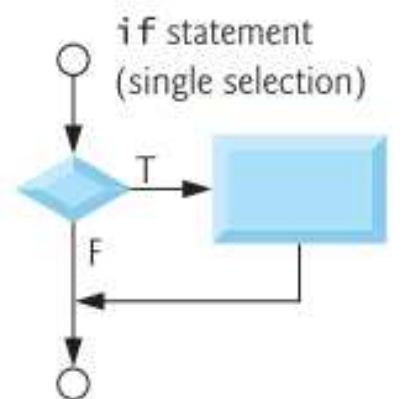

Decisions (selections)

- Three selection structure in C programming:
 - **If**
 - **If - else**
 - **Switch**

Ref: Deitel P J (Ed.) (2010) C How to Program, 6th Edition, Prentice Hall

Instructor Özgür ZEYDAN

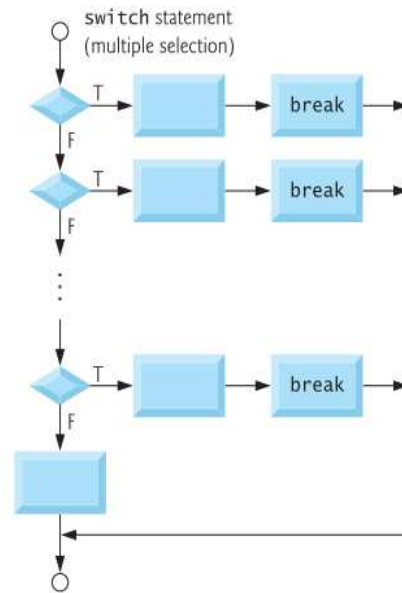

Decisions (selections)

Ref: Deitel P J (Ed.) (2010) C How to Program, 6th Edition, Prentice Hall

Instructor Özgür ZEYDAN

Loops (repetition)

- Three repetition structure in C programming:
 - While
 - Do - while
 - For

while statement

Ref: Deitel P J (Ed.) (2010) C How to Program, 6th Edition, Prentice Hall

Instructor Özgür ZEYDAN

Loops (repetition)

do...while statement

for statement

Instructor Özgür ZEYDAN

Pseudocode and Flowchart for a Decision Structure

```

If condition is true Then
  Process step(s) 1
Else
  Process step(s) 2
End If
  
```

Instructor Özgür ZEYDAN

Example - 2

- Write an algorithm to determine a student's average grade and indicate whether he is successful or not.
- The **average** grade is calculated as the average of **mid-term** and **final** marks.
- Student will be successful if his average grade is greater or equals to 60.

Instructor Özgür ZEYDAN

Pseudocode

- Start
- Use variables **mid term** , **final** and **average**
- Input **mid term** and **final**
- Calculate the **average** by summing **mid term** and **final** and dividing by 2
- if average is below 60
 Print "FAIL"
- else
 Print "SUCCESS"
- Stop

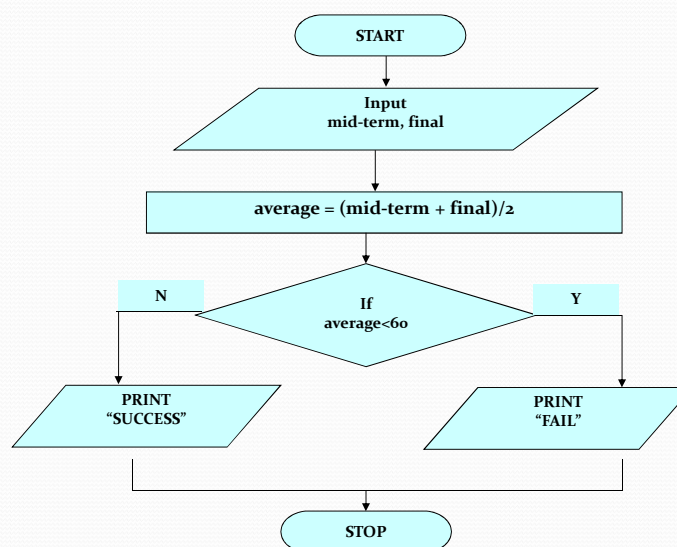

Instructor Özgür ZEYDAN

Detailed Algorithm

- 1. Step: Input **mid-term** and **final**
- 2. Step: **average** = (mid-term + final)/2
- 3. Step: if (**average** < 60) then
 Print "FAIL"
 else
 Print "SUCCESS"
endif

Instructor Özgür ZEYDAN

Flowchart

Instructor Özgür ZEYDAN

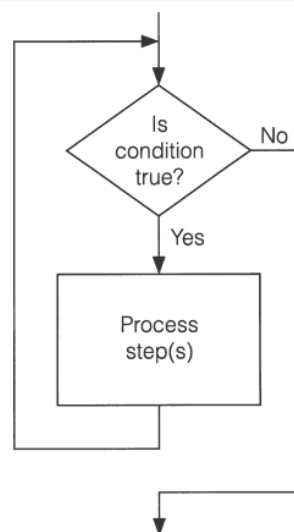

Nested If

- Simply, *if structure in if structure*
- **Example - 3:** Both final and average grades must be greater than or equals to 35 for curve calculation in BEU.
- if (**final** \geq 35) then
 - { if (**average** \geq 35) then
 - execute **curve calculation** commands
 - endif }
- else
- Print "**FF grade**"
- endif

Instructor Özgür ZEYDAN

Pseudocode and Flowchart for a Loop

Do While condition is true
 Process step(s)
 Loop

Instructor Özgür ZEYDAN

Example - 4

- Write an algorithm which calculates the average **exam grade** for a class of 5 students.
- What are the program **inputs**?
 - the exam grades
- **Processing**:
 - Find the sum of the grades;
 - count the number of students; (**counter controlled**)
 - calculate average grade = sum of grades / number of students.
- What is the program **output**?
 - the average exam grade

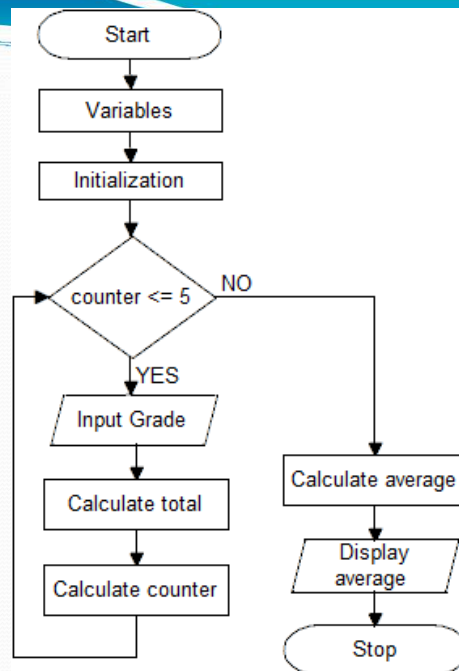

Instructor Özgür ZEYDAN

Pseudocode

- Start
- Use variables **total, counter, grade, average**
- Initialize **total** = 0
- Initialize **counter** = 1
- While (counter <= 5)
 - **Input grade**
 - **Calculate** total = total + grade
 - **Calculate** counter = counter + 1
- End-while
- **Calculate** **average** = total / 5
- **Display** average
- Stop

Instructor Özgür ZEYDAN

Flowchart

Instructor Özgür ZEYDAN

Example - 5

- Write an algorithm which calculates the average **exam grade** for a class of unknown number of students.
- What are the program **inputs**?
 - the exam grades
- **Processing**:
 - Find the sum of the grades till **sentinel value** is given; for example **-99** to break loop (**sentinel controlled**)
 - calculate average grade = sum of grades / number of students.
- What is the program **output**?
 - the average exam grade

Instructor Özgür ZEYDAN

Pseudocode

- Start
- Use variables **total**, **counter**, **grade**, **average**
- Initialize **total** = 0
- Initialize **counter** = 0
- While (**grade** != -99)
- **Input grade**
- **Calculate** **total** = **total** + **grade**
- **Calculate** **counter** = **counter** + 1
- End-while
- **Calculate** **average** = **total** / **counter**
- **Display** **average**
- Stop

Instructor Özgür ZEYDAN

Example - 6

- Write an algorithm which calculates the average **exam grade** for a class of unknown number of students.
- This time, the number of students have been asked at the beginning of the program.
- Use **counter controlled** structure.

Instructor Özgür ZEYDAN

Pseudocode

- Start
- Use variables **total**, **counter**, **grade**, **average**, **number_of_students**
- Initialize **total** = 0 , **number_of_students** = 0 , **counter** = 1
- Display “write number of students”
- Input **number_of_students**
- While (**counter** <= **number_of_students**)
 - Input **grade**
 - Calculate **total** = **total** + **grade**
 - Calculate **counter** = **counter** + 1
- End-while
- Calculate **average** = **total** / **number_of_students**
- Display **average**
- Stop

Instructor Özgür ZEYDAN

Question

- Draw a flowchart for example – 6.

Instructor Özgür ZEYDAN

Fatal Error – Memorizing

- Do not memorize any of the codes in programming.
- Read and try to understand what is given and what is asked in the question, then write your own codes.

Instructor Özgür ZEYDAN

Fatal Error – Memorizing

- If (memorize) then Display “sure that you will fail this course!!!”

Instructor Özgür ZEYDAN
